英語が得意な人のための「私大難関本番レベル」— 行動経済学とナッジの限界

2026 年 5 月 26 日

高校 3 年～既卒 (難関私大文系志望)

英語 (立命館大学 経済学部・本番水準)

Trillion 塾

第1章 (例題 — 立命館 経済学部レベル・5 分)

立命館経済英語は 80 分・大問 3 題。本問は長文 1 題で 30 分相当。

【例題】(立命館大学 経済学部 入試 典型形式・改題)

Read the passage and answer the questions that follow.

The economic textbooks of the mid-twentieth century described decision-making in terms that, on close inspection, fit no actual human being. The model agent considered the full range of options available to her, evaluated each against a stable set of preferences, calculated the expected utility of every possible course of action, and chose the one whose expected utility was highest. Real people, of course, do nothing of the sort. They satisfice rather than optimize, they treat losses as more painful than equivalent gains, they remain stuck with the option presented to them as the default rather than actively choosing among alternatives. The discrepancy between the model and the actual had been recognized for some time, but for several decades it was treated as a regrettable simplification rather than a fundamental flaw.

Beginning in the 1970s, and accelerating sharply in the years that followed, a body of empirical research, drawing on the work of the psychologists Daniel Kahneman and Amos Tversky, began to catalogue the systematic ways in which actual human decisions depart from the textbook ideal. The findings were not random; the departures clustered around identifiable patterns — loss aversion, status-quo bias, the disproportionate influence of recent or vivid information — that could be predicted and, to some extent, exploited. By the early twenty-first century, the resulting field of behavioural economics had become respectable enough that one of its founders received the Nobel Prize in 2002, and another in 2017.

A particular practical application of behavioural research, popularized by the legal scholar Cass Sunstein and the economist Richard Thaler under the label "nudge," promised to translate the new findings into a relatively painless instrument of public policy. If people stuck with whatever was presented as the default, then carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — could produce socially beneficial outcomes without restricting anyone's freedom of choice. The

approach had several attractive features. It respected the principle of consumer sovereignty by leaving the formal range of options unchanged; it was cheaper than legislation requiring particular behaviours; it could often be implemented by administrative rather than political means.

Governments across the political spectrum took notice. The British government established a Behavioural Insights Team in 2010; the Obama administration created a similar unit; the OECD set up a network for sharing nudge-based policy ideas across member states. For a moment, nudges appeared to offer a tool that could outflank the political deadlocks of the period: instead of arguing about whether the state should mandate particular outcomes, governments could simply rearrange the choice architecture and let people's natural patterns of behaviour produce the results that traditional policy had been unable to achieve.

The early enthusiasm has been followed by a more sober reassessment. Some of the original nudges, on closer examination, turned out to produce smaller effects than the early estimates had suggested, and some of those effects faded substantially over time. More worrying, critics began to point out, were the cases in which the technique worked too well in the wrong hands — in which the same insights that could be used to encourage retirement savings could also be used by private firms to encourage gambling, by political campaigns to encourage particular votes, by autocratic governments to encourage compliance with policies their citizens, asked plainly, would have rejected. The neutrality the technique seemed to promise, on this view, was an artifact of its initial association with sympathetic ends.

Behavioural economists themselves have responded to these criticisms with a more chastened account of what the discipline can and cannot deliver. The newer accounts treat nudges as one instrument among several rather than as a universal solvent; they emphasize the importance of transparent disclosure to the people being nudged; they distinguish carefully between nudges that help individuals do what they themselves would, on reflection, want to do and nudges that simply produce the outcome the nudger has decided is desirable. The disciplinary self-portrait has become considerably more modest than the celebratory framings of a decade earlier.

What seems to have settled is that behavioural economics describes a real and important feature of human decision-making, and that the techniques derived from it have a place in

the policy toolkit. What seems no longer plausible is the more ambitious claim that the new approach can substitute for, rather than supplement, the older arguments about what governments ought to do. The choice between competing public goods — between consumption and saving, between liberty and order, between private freedom and collective provision — cannot be resolved by clever choice architecture alone. It can, at most, be made slightly easier to live with once it has been resolved by other, more political means.

Q1. What did the economic textbooks of the mid-twentieth century assume about human decision-making?

- ① That people make decisions impulsively without any reasoning.
- ② That the model agent considered the full range of options, evaluated each against stable preferences, calculated the expected utility of every possible course, and chose the one with the highest expected utility — a description that fit no actual human being.
- ③ That all decisions are made collectively rather than individually.
- ④ That people have no preferences at all.

Q2. What did the empirical research by Kahneman and Tversky reveal?

- ① That human decisions are random and unpredictable.
- ② That actual human decisions depart from the textbook ideal in systematic ways — loss aversion, status-quo bias, disproportionate influence of recent or vivid information — that cluster around identifiable patterns.
- ③ That economic textbooks were entirely correct.
- ④ That only Western populations are subject to these patterns.

Q3. What is a "nudge," as popularized by Sunstein and Thaler?

- ① A legal requirement that mandates particular behaviours.
- ② A practical application of behavioural research that uses carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — to produce socially beneficial outcomes without restricting freedom of choice.
- ③ A tax on harmful goods.
- ④ A government-issued voucher system.

Q4. Why did governments across the political spectrum take notice of nudges?

- ① Because nudges appeared to offer a tool that could outflank the political deadlocks of the

period — rearranging the choice architecture instead of arguing about mandates.

- ② Because nudges replaced all need for elected legislatures.
- ③ Because nudges eliminated all government spending.
- ④ Because nudges were required by international treaty.

Q5. What is the "more worrying" critique that critics began to raise, according to the fifth paragraph?

- ① That the same insights that could be used to encourage retirement savings could also be used by private firms to encourage gambling, by political campaigns to encourage particular votes, or by autocratic governments to encourage compliance — so the technique's apparent neutrality was an artifact of its initial association with sympathetic ends.
- ② That nudges are too expensive to implement.
- ③ That nudges have no measurable effect at all.
- ④ That nudges are technically illegal in most countries.

Q6. Which of the following best summarizes the author's overall conclusion?

- ① Behavioural economics has been entirely refuted and should be abandoned.
- ② Behavioural economics describes a real feature of human decision-making and nudges have a place in the policy toolkit, but the more ambitious claim that the new approach can substitute for political argument about what governments ought to do is no longer plausible; choices between competing public goods cannot be resolved by clever choice architecture alone.
- ③ Nudges should be mandated for every policy decision worldwide.
- ④ The mid-twentieth-century economic textbooks have been definitively confirmed.

行動経済学とナッジ — 革新と限界

図 1-1 古典経済学 (homo economicus) → 行動経済学 (実証的人間モデル) → ナッジ (政策技法)

第2章 (解法の全体方針と武器整理・3 分)

立命館経済の長文は「古典モデル → 実証的反証 → 政策応用 → 政治的採用 → 批判 → 学界の自己抑制 → 統合結論」の 7 段論法。

【ジャンル分析】

本文は典型的な (A) behavioural economics + public policy essay。著者は 7 段かけて、行動経済学とナッジの「興隆 → 批判 → 自己抑制」を描く。(B) 立命館経済の長文は経済学と政策科学の交差が頻出。

【本問で必要な 4 つの武器】

- ① (A) 理論モデル → 実証 → 政策 の連鎖
- ② (B) nudge の二面性 (善用と悪用)
- ③ (C) 行動経済学用語の文脈推測 — "satisfice" "loss aversion" "status-quo bias" "choice architecture"
- ④ (D) 著者の立場 = 中立的観察者と読む

【各設問の戦略】

Q1 (古典モデル) → 第 1 段 "model agent considered the full range ... expected utility"

Q2 (実証研究) → 第 2 段 "loss aversion, status-quo bias, disproportionate influence"

Q3 (nudge 定義) → 第 3 段 "carefully chosen defaults ... without restricting anyone's freedom"

Q4 (政府採用) → 第 4 段 "outflank the political deadlocks"

Q5 (悪用批判) → 第 5 段 "private firms to encourage gambling, by political campaigns ... autocratic governments"

Q6 (全体結論) → 最終段 "cannot be resolved by clever choice architecture alone"

第3章 (Q1 + Q2 — 古典モデル + 行動経済学・8 分)

「理論」と「実証」を続けて聞く。

【Q1 設問】 What did the economic textbooks assume about human decision-making?

★ 第 1 段の論理

"The model agent (A) considered the full range of options available to her, evaluated each against a stable set of preferences, calculated the expected utility of every possible course of action, and chose the one whose expected utility was highest. Real people, of course, do nothing of the sort."

★ Q1 paraphrase

本文 "considered the full range ... evaluated each against ... calculated the expected utility ... chose the one ... highest ... no actual human being"

選択肢② "the model agent considered the full range of options, evaluated each against stable preferences, calculated the expected utility of every possible course, and chose the one with the highest expected utility — a description that fit no actual human being"
→ 直接対応。

【Q1 正解】 ② That the model agent considered the full range of options, evaluated each against stable preferences, calculated the expected utility of every possible course, and chose the one with the highest expected utility — a description that fit no actual human being.

【Q2 設問】 What did the empirical research by Kahneman and Tversky reveal?

★ 第 2 段の論理

"The findings were not random; the departures clustered around identifiable patterns — (A) loss aversion, status-quo bias, the disproportionate influence of recent or vivid information — that could be predicted and, to some extent, exploited."

★ Q2 paraphrase

本文 "departures clustered around identifiable patterns — loss aversion, status-quo bias, disproportionate influence of recent or vivid information"

選択肢② "actual human decisions depart from the textbook ideal in systematic ways — loss aversion, status-quo bias, disproportionate influence of recent or vivid information — that cluster around identifiable patterns"

→ 直接対応 (3 つの bias 名すべて一致)。

【Q2 正解】 ② That actual human decisions depart from the textbook ideal in systematic ways — loss aversion, status-quo bias, disproportionate influence of recent or vivid information — that cluster around identifiable patterns.

💡 重要概念: loss aversion (損失回避) = Kahneman の Prospect Theory の核心。損失は等価な利得よりも約 2 倍強く感じる。

第4章 (Q3 + Q4 — nudge 定義 + 政府採用・10 分)

「技法」と「政治的拡散」を続けて聞く。立命館経済の中核設問。

【Q3 設問】 What is a "nudge," as popularized by Sunstein and Thaler?

★ 第 3 段の論理

"If people stuck with whatever was presented as the default, then (A) carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — could produce socially beneficial outcomes without restricting anyone's freedom of choice."

★ Q3 paraphrase

本文 "carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — could produce socially beneficial outcomes without restricting anyone's freedom of choice"

選択肢② "A practical application of behavioural research that uses carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — to produce socially beneficial outcomes without restricting freedom of choice"

→ 直接対応 (2 つの典型例と「自由を制限しない」両方含む)。

【Q3 正解】 ② A practical application of behavioural research that uses carefully chosen defaults — automatic enrolment in retirement savings, opt-out organ donation systems — to produce socially beneficial outcomes without restricting freedom of choice.

【Q4 設問】 Why did governments take notice of nudges?

★ 第 4 段の論理

"For a moment, nudges appeared to offer (A) a tool that could outflank the political deadlocks of the period: instead of arguing about whether the state should mandate particular outcomes, governments could simply (B) rearrange the choice architecture and let people's natural patterns of behaviour produce the results that traditional policy had been unable to achieve."

★ Q4 paraphrase

本文 "outflank the political deadlocks ... rearrange the choice architecture"

選択肢① "nudges appeared to offer a tool that could outflank the political deadlocks of the period — rearranging the choice architecture instead of arguing about mandates"
→ 直接対応。

【Q4 正解】① Because nudges appeared to offer a tool that could outflank the political deadlocks of the period — rearranging the choice architecture instead of arguing about mandates.

★ 重要観察 — Q3 と Q4 の連動

Q3 = 技法の中身 → Q4 = 採用の動機。 (A) 「政治的便利さ」 が初期 enthusiasm の理由。これが第 5 段の批判 (「悪用される」) への伏線。

nudge の二面性 — 同じ insight, 違う ends

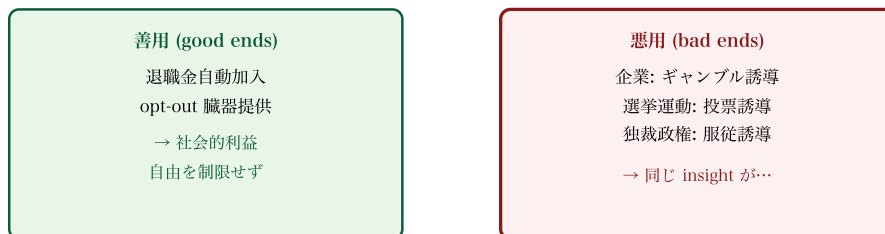

図 5-1 nudge の中立性は幻想 — 同じ技法が異なる ends に動員される

第5章 (Q5 — 悪用批判・5 分)

「中立性の崩壊」を読む。本文の最も鋭い批判。

【設問】 What is the "more worrying" critique that critics began to raise?

★ 第 5 段の論理

"the cases in which the technique worked too well in the wrong hands — in which (A) the same insights that could be used to encourage retirement savings could also be used by private firms to encourage gambling, by political campaigns to encourage particular votes, by autocratic governments to encourage compliance with policies their citizens, asked plainly, would have rejected."

"(B) The neutrality the technique seemed to promise, on this view, was an artifact of its initial association with sympathetic ends."

★ paraphrase 対応

本文 "same insights ... encourage retirement savings ... private firms to encourage gambling, by political campaigns to encourage particular votes, by autocratic governments to encourage compliance ... neutrality ... was an artifact of its initial association with sympathetic ends"

選択肢① "the same insights that could be used to encourage retirement savings could also be used by private firms to encourage gambling, by political campaigns to encourage particular votes, or by autocratic governments to encourage compliance — so the technique's apparent neutrality was an artifact of its initial association with sympathetic ends"

→ 直接対応 (3 つの悪用例すべて + 中立性批判)。

★ 誤答分析

- ・ ② "too expensive" → (A) 論点ずれ。本文に費用論なし。
- ・ ③ "no measurable effect" → 本文と (B) 逆方向。本文は「too well in the wrong hands」と効果を認める。
- ・ ④ "technically illegal" → (C) 論点ずれ。法的問題ではない。

【正解】 ① That the same insights that could be used to encourage retirement savings could also be used by private firms to encourage gambling, by political campaigns to

encourage particular votes, or by autocratic governments to encourage compliance — so the technique's apparent neutrality was an artifact of its initial association with sympathetic ends.

💡 重要概念: dual-use 問題。同じ技術が用途次第で善にも悪にもなる (核技術 / AI / 遺伝子工学 等)。nudge も例外ではない。

第6章 (Q6 — Main Idea 設問 + 関連話題・10 分)

経済学エッセイの結論は「統合 + 政治的還元の不可」型。

【設問】 Which of the following best summarizes the author's overall conclusion?

★ 最終段の精読

"What seems to have settled is that (A) behavioural economics describes a real and important feature of human decision-making, and that the techniques derived from it have a place in the policy toolkit."

"What seems no longer plausible is the more ambitious claim that (B) the new approach can substitute for, rather than supplement, the older arguments about what governments ought to do."

"The choice between competing public goods — between consumption and saving, between liberty and order, between private freedom and collective provision — (C) cannot be resolved by clever choice architecture alone. It can, at most, be made slightly easier to live with once it has been resolved by other, more political means."

→ 主旨 3 要素:

- ①行動経済学は実体ある発見 + 政策工具箱の一部
- ②古い政治的議論を substitute はできない、supplement のみ
- ③公共財選択は choice architecture で解けない

★ 選択肢②との対応

"Behavioural economics describes a real feature of human decision-making and nudges have a place in the policy toolkit, but the more ambitious claim that the new approach can substitute for political argument about what governments ought to do is no longer plausible; choices between competing public goods cannot be resolved by clever choice architecture alone"

→ 3 要素すべて含む。

【正解】 ② Behavioural economics describes a real feature of human decision-making and nudges have a place in the policy toolkit, but the more ambitious claim that the new approach can substitute for political argument about what governments ought to do is no

longer plausible; choices between competing public goods cannot be resolved by clever choice architecture alone.

第7章 (立命館経済英語 攻略のコツ・5 分)

立命館経済長文を完答するための 5 つの技術。

【コツ 1】 7 段論法 (古典モデル → 実証反証 → 政策応用 → 政治的拡散 → 批判 → 自己抑制 → 統合結論) を予測

【コツ 2】 行動経済学者の固有名詞

- ・ (A) Kahneman / Tversky / Thaler / Sunstein — 行動経済学・ナッジの四天王
- ・ (B) Herbert Simon / Daniel Ariely / Robert Cialdini — 関連研究者
- ・ (C) Behavioural Insights Team (UK) / OECD Network — 政府実装機関
- ・ (D) Akerlof / Shiller — Animal Spirits 派

【コツ 3】 立命館経済頻出語の文脈推測

satisfice / optimize / utility / preference / loss aversion / status-quo bias / choice
architecture / default / nudge / outflank

【コツ 4】 誤答パターン 4 種 (立命館経済版)

- ・ (A) 極端化: entirely refuted / mandated for every / definitively confirmed
- ・ (B) 技術絶対主義: solve all political problems / replace legislatures
- ・ (C) 論点ずれ: コスト・違法性 — 本文の関心外
- ・ (D) 逆方向: 古典派 vs 行動派を取り違える

【コツ 5】 時間配分 (立命館 80 分)

長文には(A) 30 分を上限。

【最後にひとこと】

立命館経済の英語は(A) 語学試験であると同時に(B) 経済学リテラシー試験。本間の行動経済学・ナッジ論は、入学後に学ぶ行動経済学・公共経済学の核心テーマ。

第8章 (類題チャレンジ・10 分) [10 点]

本講義の手法を応用する 5 問。

(類題 1) 本文中の "satisfice" の意味として最も近いものを選びなさい。

- ① 「満足できる水準」で意思決定を止める (optimize の対概念)
- ② 完全に満足するまで探索する
- ③ 全選択肢を網羅的に評価する
- ④ 他者の選択に従う

(類題 2) 本文の "choice architecture" が示唆するものとして最も適切なものを選びなさい。

- ① 選択肢の提示順序・デフォルト設定など意思決定環境の構造的設計
- ② 建築物の選択肢
- ③ 選挙制度の設計
- ④ 教育課程の選択肢

(類題 3) 本文中で「opt-out organ donation」が引用される目的として最も適切なものを選びなさい。

- ① デフォルト変更だけで臓器提供率が大幅に向上する nudge の典型成功例として
- ② 臓器移植医療の歴史的失敗例として
- ③ 宗教的問題の事例として
- ④ 国際法違反の事例として

(類題 4) 本文の "sympathetic ends" が示唆するものとして最も適切なものを選びなさい。

- ① 退職金・健康・臓器提供など多くの人が同意する善い目的
- ② 感情的に共感できる人物
- ③ 共産主義的目標
- ④ 外交的友好関係

(類題 5) 本文の論理構成として最も近いものを選びなさい。

- ① 古典モデル (homo economicus) → 実証反証 (Kahneman+) → 政策応用 (nudge) → 政府採用 (BIT 等) → 批判 (悪用懸念) → 学界の自己抑制 → 統合結論 (政治還元不可)
- ② 結論先出し → 根拠列举のみ
- ③ 賛成意見の単純な列举
- ④ 歴史的説明のみで結論なし

第9章 (まとめ・宿題・5 分)

今日の核心整理と立命館経済本番に向けた宿題

【本日の核心 5 か条】

- ① 経済学エッセイは (A) 「理論 → 実証反証 → 政策応用 → 批判 → 統合」 の 7 段論法。
- ② (B) Kahneman / Thaler / Sunstein の系譜は立命館経済頻出。
- ③ (C) nudge の二面性 (善用 vs 悪用) = dual-use 問題。
- ④ 誤答パターンは「(D) 技術絶対主義」(solve all political problems)。
- ⑤ 主旨設問は(A) 「technology は政治を substitute できない」 型を選ぶ。

【宿題】

- ① 本講義の Q1-Q6 を見ないで本文だけ読み直し、自分で 6 問の設問を作成。
- ② 類題 5 問を解き直し、本文 7 段の各段にひと言タイトルを書き出す。
- ③ 過去問: 立命館大学 経済学部 英語 (過去 5 年分) から長文 1 題を選び、本日の手法で精読する。

【最後にひとこと】

立命館経済の英語は(A) 語学試験であると同時に(B) 経済学リテラシー試験。本間の行動経済学・ナッジ論は、入学後に学ぶ行動経済学・公共経済学の核心テーマ。
